III.	Development of Weighting and Ratings	3
IV.	Database Development	6
V.	Testing of the Database	8
	Utilization of Main Rankings	
VII	I. Conclusion	10

#### I. Background

As of 2001, approximately 2.7 million lineal feet, or 17%, of Illinois-American Water Company's (IL-AWC's) total water main footage is sized 4-inches in diameter and less. Of these mains, approximately 73% are 3-inches in diameter or less. With the understanding that continued enhancement of the IL-AWC systems would require a systematic replacement of these small diameter mains, IL-AWC Engineering (Engineering) developed a 2001 goal to research and develop tools to assist the state in replacing these small mains.

During the first part of 2001, Engineering embarked on this goal. Along with input by the Northern District, a small diameter main prioritization model was developed for initial use by the Pekin District, since 22% (190,000 feet) of its distribution system consisted of mains with a size of 4-inches or less.

After development and testing with the Pekin District, it was determined that the Small Main Prioritization Model would be further utilized as a state-wide main assessment standard to assist the districts in developing annual main replacement programs.

#### II. Development of Main Replacement Criteria

In January 2001, associates from Engineering and the Northern Division met to establish a developmental team for the prioritization model. The team was comprised of Mark Johnson, Kelly Simpson, Brent O'Neill and Gene Mann from the Engineering group and Kevin Hillen, Randy West and Dan Durdle from the Northern Division.

The developmental team determined that a main replacement assessment standard would require adoption of several criteria to determine which mains would need to be replaced. The initial committee developed eight (8) criteria that were thought to play a major role in

providing reliable service. These criteria are included in Table A. During the first developmental meeting it was determined that several of the criteria had interrelationships. One of the interrelationships was main size and fire flow. In addition, it was determined that leaks can also be related to the age and material of the mains.

Table A - Main Rep	lacement Criteria
Low Pressure	Material
Number of Leaks	Size
Fire Flow	Water Quality
Main Age	Dead End

#### III. Development of Weighting and Ratings

Due to the interrelationships of the eight (8) criteria, the team established relative weights for each criteria. Age, material type and size were the primary criteria that would be used to determine main replacement. Initially, these three accounted for 55% of the total weight by the eight criteria. Upon further refinement, the total weighting for these three criteria weight was revised to 50%. See Exhibit A for all the criteria weighting values.

Along with the criteria weighting, the team developed rating standards for each of the eight (8) criteria. It was determined that a numeric rating of between 1 and 5 should be used for each criteria – with 1 being the better rating and 5 being the worst rating. Exhibit A summarizes the ratings for each criteria. The following describes the rating standards for each criteria:

#### • Low Pressure

Rating	<u>Pressure</u>
1	50 psi or greater
2	40 psi to < 50 psi
. 3	35 psi to < 40 psi
4	30 psi to < 35 psi
5	< 30 psi

#### • Number of Leaks

It was determined that due to the lack of "consistent" data regarding leaks state-wide that this item rating should be conducted subjectively by the district and the audit team. The rating would be such that a rating of 1 would be assigned to those areas that have no problems of leaks and graduating to a rating of 5 where mains experience a large amount of leaks. It was recommended that a uniform state-wide leak database be developed.

#### • Fire Flow

It was decided that two rating groups needed to be established for fire flow to account for residential areas and commercial areas within the distribution system. Industrial areas were not considered as they typically do not have small diameter water mains. Using these as a guideline the following ratings were developed:

Rating	Residential Areas	Commercial Areas
1	1,500 gpm and greater	2,500 gpm and greater
2	1,000 gpm to < 1,500 gpm	2,000 gpm to < 2,500 gpm
3	750 gpm to < 1,000 gpm	1,500  gpm to < 2,000  gpm
4	500 gpm to < 750 gpm	1,000 gpm to < 1,500 gpm
5	less than 500 gpm	less than 1,000 gpm

#### • Age

The age rating was created utilizing the Missouri American/St. Louis County age criteria. These ratings include the time frames of change in the material types installed.

Rating	Date of Installation
1	1990 or later
2	1980 to 1989
3	1970 to 1979
4	1960 to 1969
5	1959 and prior

#### • Material

A listing of 10 different water main materials was developed and utilized in developing the following ratings. The ratings range from 1 being the most desirable pipe material to 5 being the least desirable material.

Rating	Main Material Type
1	Ductile Iron/Reinforced Concrete Pipe (RCP)
2	Transite
3	PVC/ HDPE
4	Cast Iron
5	Galvanized/ Steel

#### Size

Rating	<u>Main Size</u>
1	8 inch and above
2	6 inch
3	4 inch
4	2 inch and 3 inch
5	main smaller than 2 inch

#### • Water Quality

The subjective nature of this rating requires input by the district and the audit team. A rating of 1 would be assigned to those areas that have no historical problems with water quality, graduating to a rating of 5 where major water quality problems are experienced. It was recommended that customer complaint information be used as a basis of the rating.

#### • Dead End Main

The number of customers situated on a dead end main is used to develop this rating. Further development of this criterion during the testing of the small main program resulted in a determination that the same customer criteria rating be utilized for those mains that are not considered dead ends.

Rating	Main Size
1	less than 2 customers or a main not
	designated a dead end main
2	2 to 5 customers
3	6 to 10 customers
4	11 to 20 customers
5	greater than 20 customers

The combination of criteria weighting and criteria rating standards gives a maximum rating of 500 points (worst case) and a minimum rating of 100 points (best case). As an example, the 246 main segments analyzed within the Pekin System had a maximum main rating of 380 points and a minimum main rating of 190 points.

#### IV. Database Development

An electronic database was developed to assist the districts in the assessment and prioritization of their small mains and subsequent development of replacement schedules. An Access Database was developed to allow consistent entry of data by the districts and to assign the criteria ratings and weighting with little intervention by the operator.

In order to simplify the entry of data into the database, an entry screen was developed that allows the operator to enter specific main rating information into the database. Exhibit B provides an example of the database main entry screen. The database is designed to perform the necessary queries and calculations to determine the main section overall rating and ranking.

As an added benefit, the database develops a listing of small mains within each district system and provides detailed records for each main. Exhibit C provides an example of the District Main Inventory List. This listing is incorporated into the database and can be used to create reports accessible from the database menus.

The model requires that mains would be entered into the model through defined water main segments. In order to allow the districts to develop comprehensive replacement programs, consideration was given to the length of segments that could be effectively replaced per budget cycle. A majority of the mains placed within the model contained segments that were approximately 300 to 500 lineal feet. In addition, consideration was given so that each segment had access to a main with a size of 6-inches or greater to allow for improvements in service as the mains were replaced. In some situations, main segments developed for the model maybe greater than the one or two blocks due to the inability to provide sufficient interconnections to the proposed replacement main.

Anticipated costs for replacement of the mains were added to the database during the final stages of development to allow for the determination of the approximate cost for each main for use during budgeting. It is intended that the replacement cost developed by the database is utilized only for an approximate budget number and that detailed cost estimates will still need to be developed.

Finally, priority levels were developed to assist the Districts in determining which mains should be replaced first. Currently there are seven (7) priority levels. Table B indicates the range of each level.

Table B – Priority Le	vels and Rating Range
Priority Level	Rating Range
A	350 to 500
В	300 to 350
С	250 to 300
D	200 to 250
E	150 to 200
F	100 to 150
G	0 to 100

#### V. Testing of the Database

The Pekin District system was utilized to test the database and allow review of the assessment standards. During this time, the Pekin District was going through a Comprehensive Planning Study Revision and system information was readily available.

Approximately 246 small mains segments were entered into the database. The main segments entered were those mains that were 4 inches and less, or 6-inch mains that were known to have problems. In addition, the mains were entered in one or two block sections to allow for a better representation of replacement costs and construction scheduling.

The data was entered using various sources of input data. A large portion of the initial data entry required utilization of distribution maps to identify main sizes and locations. District information with regard to main material and year of installation was obtained during visits to the district office. In addition, site visits were required in Pekin to determine the number of customers on each main. The next step was the review of past customer complaints and discussions with district operation representatives to determine water quality complaints/concerns and past leak information. Lastly, the hydraulic model was utilized to provide

static pressures for each of the mains. It is estimated that the combined effort for Engineering and district associates was approximately 160 man-hours to gather and enter the data into the database for Pekin.

After data entry, the main ratings were reviewed for accuracy. Initial review indicated that the database placed a higher than anticipated priority to dead end mains at the detriment of the other mains within the database and that the final main ratings were too clustered to allow for easy determination of main priority. As a result, the database was adjusted to eliminate the dead end main criteria and adjusted to include the number of customers located on the main. By making this change the database was able to give higher priority to those mains that had numerous customers compared to those mains which served only a few.

In order to address the problem of the database making large grouping of mains with similar ratings, two criteria weights were adjusted. As previously indicated, the main size criteria weight was adjusted to 20% instead of 25% and the pressure criteria weight was increased from 10% to 15%. This allowed for a more diverse main rating and assisted in the development of a more efficient way to prioritize the mains.

Appendix A includes two reports from the final database for the Pekin District. The first report is a District Rating Criteria Weighting List that ranks the main segments and indicates the ratings for each of the eight (8) criteria. In addition the list indicates the map page number of each main segment to allow for the districts to establish projects in close proximity to each other during a given year.

The second report is a District Main Priority and Cost listing, which provides the district with the main ratings of each main and groups them by priority levels. The report also provides the district with an approximate cost for replacement for each main and also totals the replacement costs in each priority level.

#### VI. Utilization of Main Rankings

It is anticipated that the mains with the highest rankings will be replaced first. However, the districts should make adjustments based on roadway improvements by the local municipality and proximity of other main replacement work during that construction season. Also, as main improvements occur throughout the system, other mains on the list may change priority ratings due to improvements in adjacent areas. The database should be updated each year to ensure updated main segment ratings.

#### VII. Conclusion

Data entry for the Pekin District was completed during the third quarter of 2001. The prioritization model predicts justifiable main replacement projects for the Pekin District.

It is recommended that the model be rolled-out to the remaining IL-AWC districts. As of this writing, three (3) additional districts have been analyzed using the model. These districts include Champaign County, Streator and Sterling.

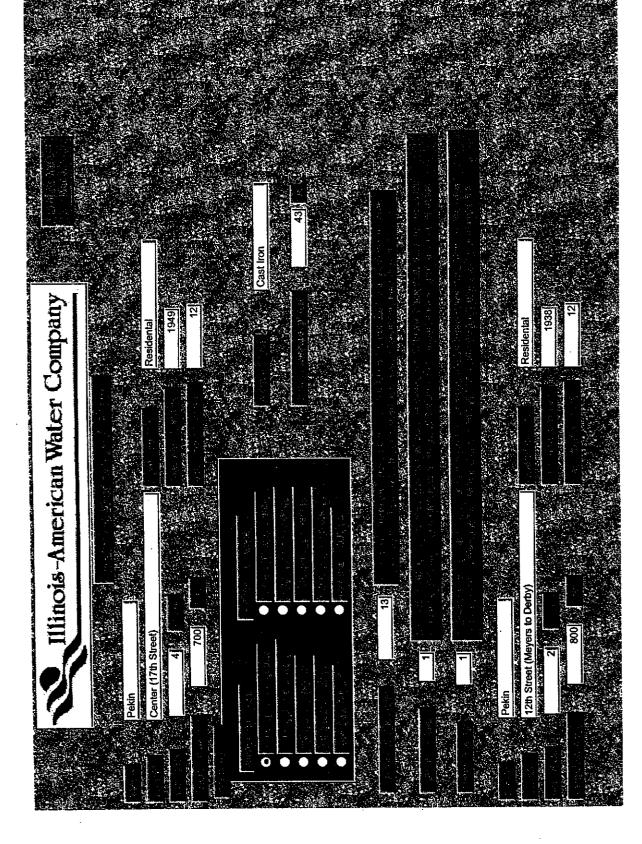

It is expected that through further development and utilization of the small main prioritization model, IL-AWC should be able to systematically replace small diameter mains in high priority areas and allow each district to efficiently address system deficiencies.
